

CLM Tag Builder — Word Add-in Setup Guide

Files you need

```
clm-tag-builder/  
├─ taskpane.html    ← the add-in UI  
└─ manifest.xml     ← tells Word where to find the add-in
```

Step 1 — Serve taskpane.html locally over HTTPS

Word add-ins **must** be served over HTTPS, even for local testing. The easiest way is using `http-server` with a self-signed cert.

Option A — Node.js (recommended)

```
bash  
  
# Install once  
npm install -g http-server  
  
# Run from your clm-tag-builder folder  
http-server . -p 3000 --ssl --cert ~/.localhost-ssl/localhost.crt --key ~/.localhost-ssl/localhost.key
```

If you don't have a local cert, generate one:

```
bash  
  
npm install -g office-addin-dev-certs  
npx office-addin-dev-certs install
```

This installs a trusted dev cert at `~/.office-addin-dev-certs/`. Then run:

```
bash  
  
http-server . -p 3000 --ssl \  
  --cert ~/.office-addin-dev-certs/localhost.crt \  
  --key  ~/.office-addin-dev-certs/localhost.key
```

Option B — Python + mkcert (alternative)

```
bash
```

```
mkcert localhost
python3 -c "
import http.server, ssl
s = http.server.HTTPServer(('localhost', 3000), http.server.SimpleHTTPRequestHandler)
ctx = ssl.SSLContext(ssl.PROTOCOL_TLS_SERVER)
ctx.load_cert_chain('localhost.pem', 'localhost-key.pem')
s.socket = ctx.wrap_socket(s.socket, server_side=True)
s.serve_forever()
"
```

Verify it works by visiting <https://localhost:3000/taskpane.html> in your browser.

Step 2 — Sideload the manifest into Word

On Windows

1. Press **Win + R**, type: `%APPDATA%\Microsoft\Word\STARTUP`
2. Copy `manifest.xml` into that folder
3. Open Word → **Insert** → **My Add-ins** → **Shared Folder**
4. Select **CLM Tag Builder** and click **Add**

On Mac

1. Open Finder → Go → `~/Library/Containers/com.microsoft.Word/Data/Documents/wef/`
(create the `wef` folder if it doesn't exist)
2. Copy `manifest.xml` into that folder
3. Open Word → **Insert** → **My Add-ins** → **Developer Add-ins**
4. Select **CLM Tag Builder**

On Word Online (any OS — easiest)

1. Go to <https://office.com> and open any Word document
2. **Insert** → **Office Add-ins** → **Upload My Add-in**
3. Browse to `manifest.xml` and upload

Step 3 — Use the add-in

1. The **CLM Tag Builder** taskpane will open on the right side of Word
2. Build your condition rules (manual or paste-to-parse)

3. Select any text in your Word document
 4. Click **Insert Tag Around Selection**
 5. The open/close tags are inserted around the selected text — formatting preserved 
-

Troubleshooting

Issue	Fix
Taskpane shows blank / "can't reach page"	Make sure your local server is running on port 3000
SSL error in browser	Visit https://localhost:3000 directly and accept the cert warning
"No text selected" error	Click into the Word doc first, then select text before clicking Insert
Add-in doesn't appear in My Add-ins	Check manifest.xml is in the correct STARTUP / wef folder

Updating the add-in

Just edit `taskpane.html` and reload the taskpane (taskpane menu → Reload). No re-sideloadng needed.
